1: THE PROBLEM WE'RE TRYING TO SOLVE IS THE AUTOMATIC DETECTION OF SPAM MESSAGES.

SCOPE

The goal is to make a model that can differeciate between a regular message, and a spam one, typically some advertisement or malicious message. The system would for example be used in iMessage, Disocord, WhatsApp, exc. and ran locally for privacy reasons. Some of these examples have equivalent soutions already. Without machine learning, this this task is extremely impractical to solve. I cant really see any other way to solve this, than having someone manually look over texts and decide if they are spam or not.

METRICS

Describe how the performance will be measured.

2: DATA

3: MODELING

4: DEPLOYMENT
